Can we see a climate change signal consistent with Global Climate Model (GCM) simulations in the available Radio Occultation (RO) record?

- climate change detection time estimates by Leroy et al. (2006) and Ringer & Healy (2008): 6–16 years of data
- use optimal fingerprinting method
- same method implemented for RO climatologies of different zonal mean horizontal resolutions

- monthly mean **GPS/Met** (10/1995, 02/1997) and **CHAMP** (09/2001-02/2008, without 07-08/2006) data
- 8 pressure levels from 300 hPa to 30 hPa
- zonal mean bands between 50°N and 50°S (3 resolutions)
- refractivity , geopotent. height, temp. trend patterns

$$\mathbf{y}_{RO} = \mathbf{X}_{fGCM} \beta + \epsilon_{PICTRL}$$

- monthly mean **GPS/Met** and **CHAMP** data
 - 5 zonal mean bands (focus of trend detection)
 - 10° zonal mean bands
 - zonal mean profile btw 50°N and 50°S
- 3 representative GCMs from IPCC AR4 (20th cent., A2 and B1)
 - CCSM3/NCEP-NCAR: 12 A2/B1 simulations
 - ECHAM5/MPI-M: 6 A2/B1 simulations
 - HadCM3/UK Met Office: 2 A2/B1 simulations

- estimate scaling factors $\hat{\beta}$ via

$$\hat{\beta} = (\mathbf{X}^T \mathbf{C}^{-1} \mathbf{X})^{-1} \mathbf{X}^T \mathbf{C}^{-1} \mathbf{y}$$

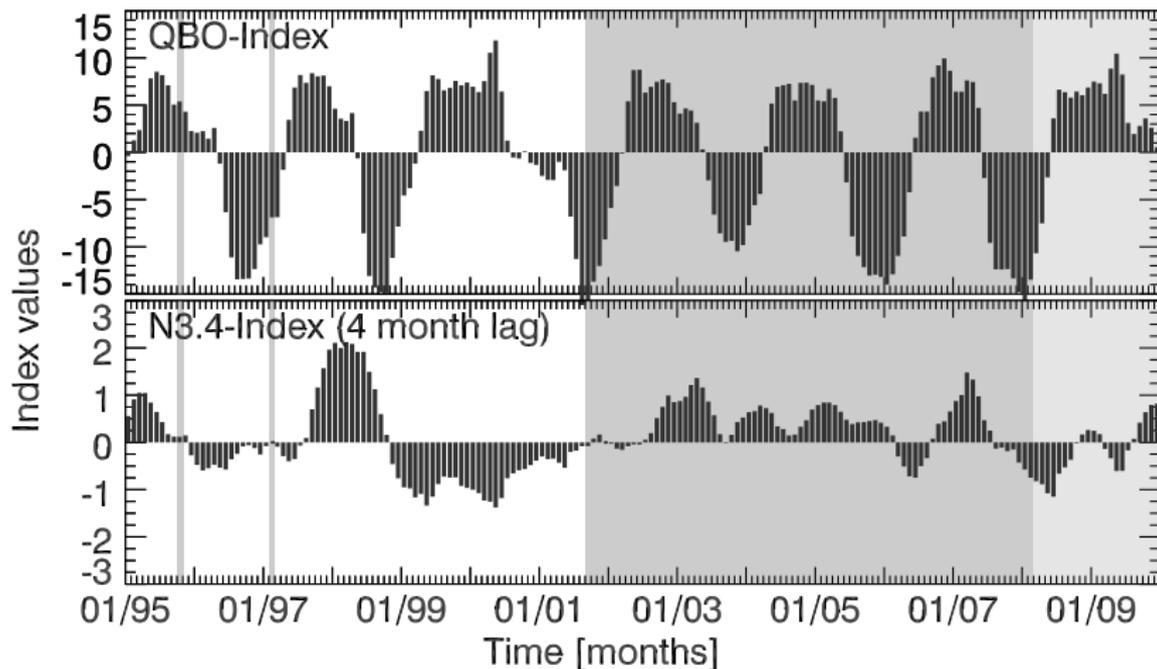

- PICTRL simulations of GCMs to estimate nat. variability (**C**)

QBO and El Niño During the Study Period

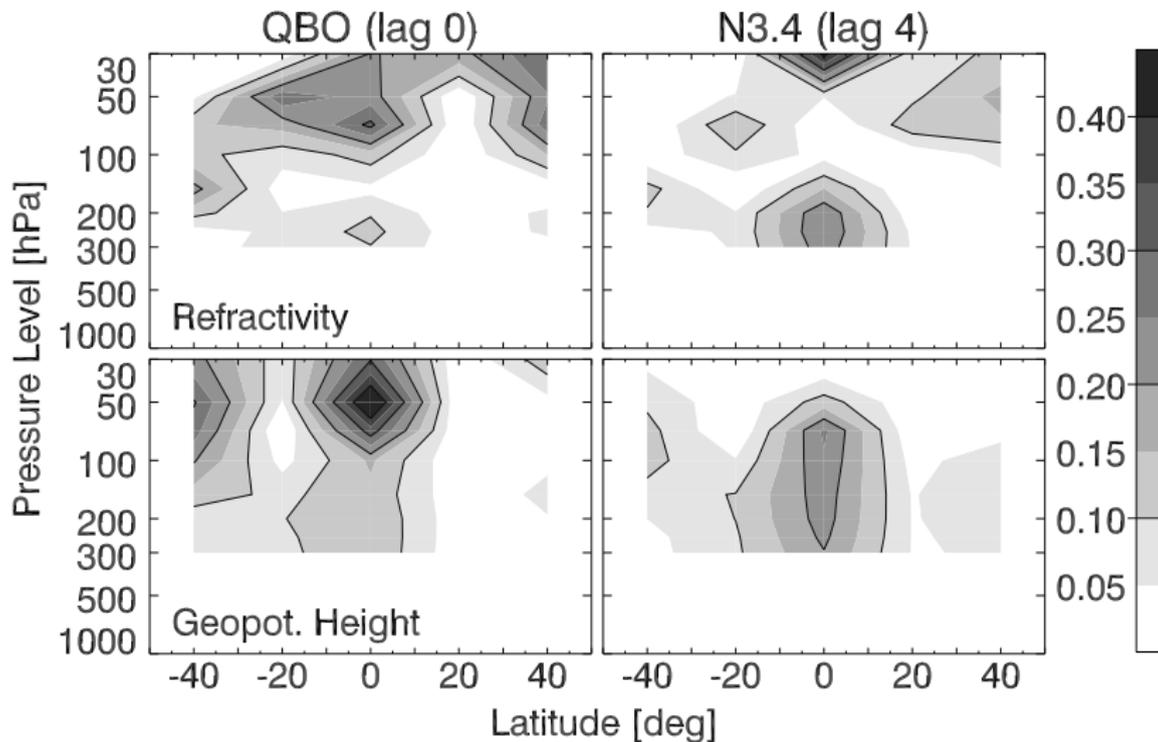

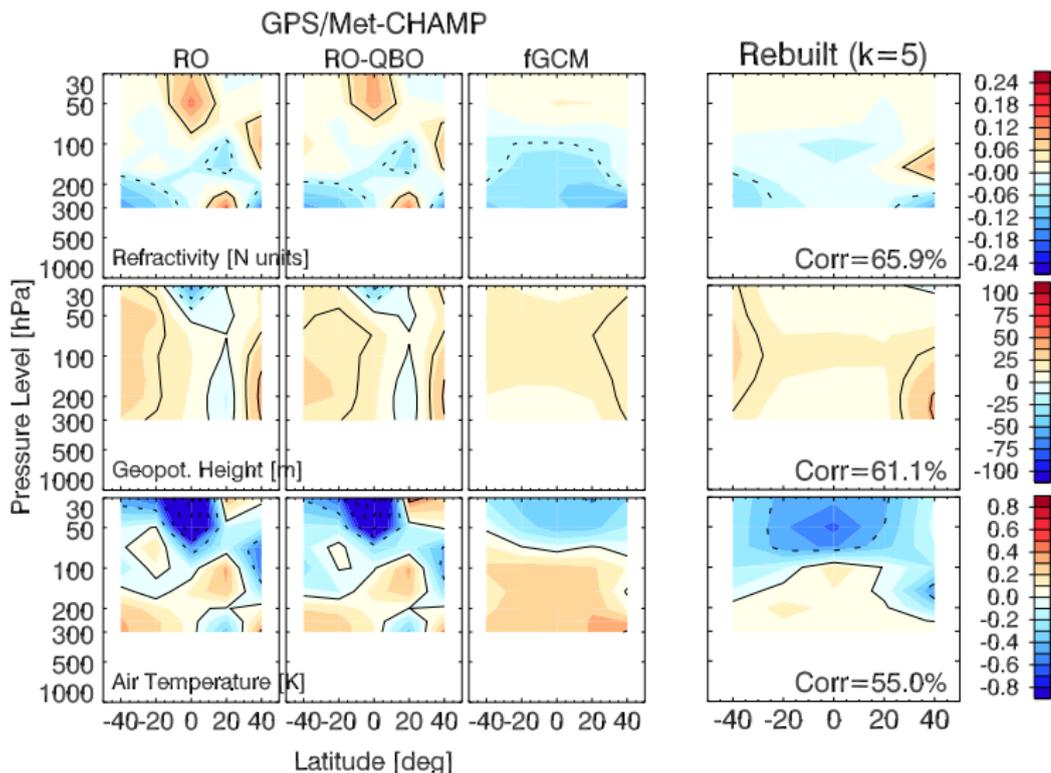

Wegener Center

UNI
CRAZ

Explained Variance (R^2) of QBO and El Niño in RO Data

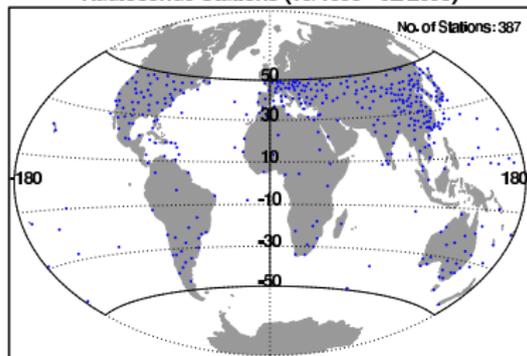

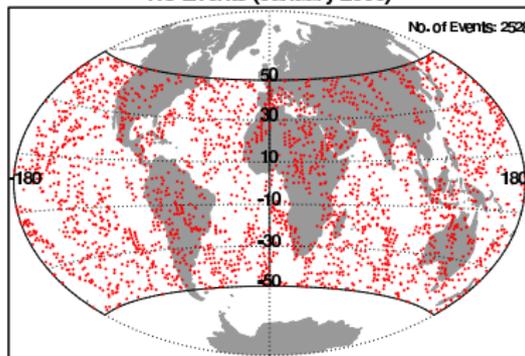

Distribution of Measurements for Radiosondes and RO

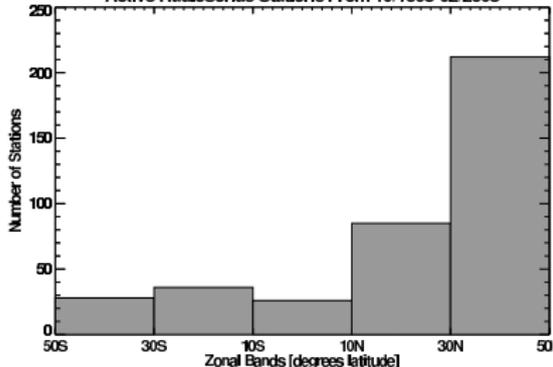

Radiosonde Stations (10/1995 - 02/2008)

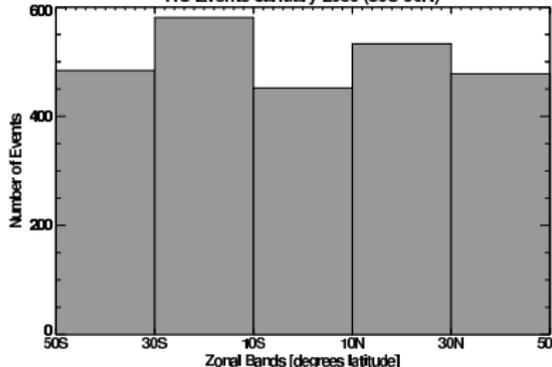

RO Events (January 2006)

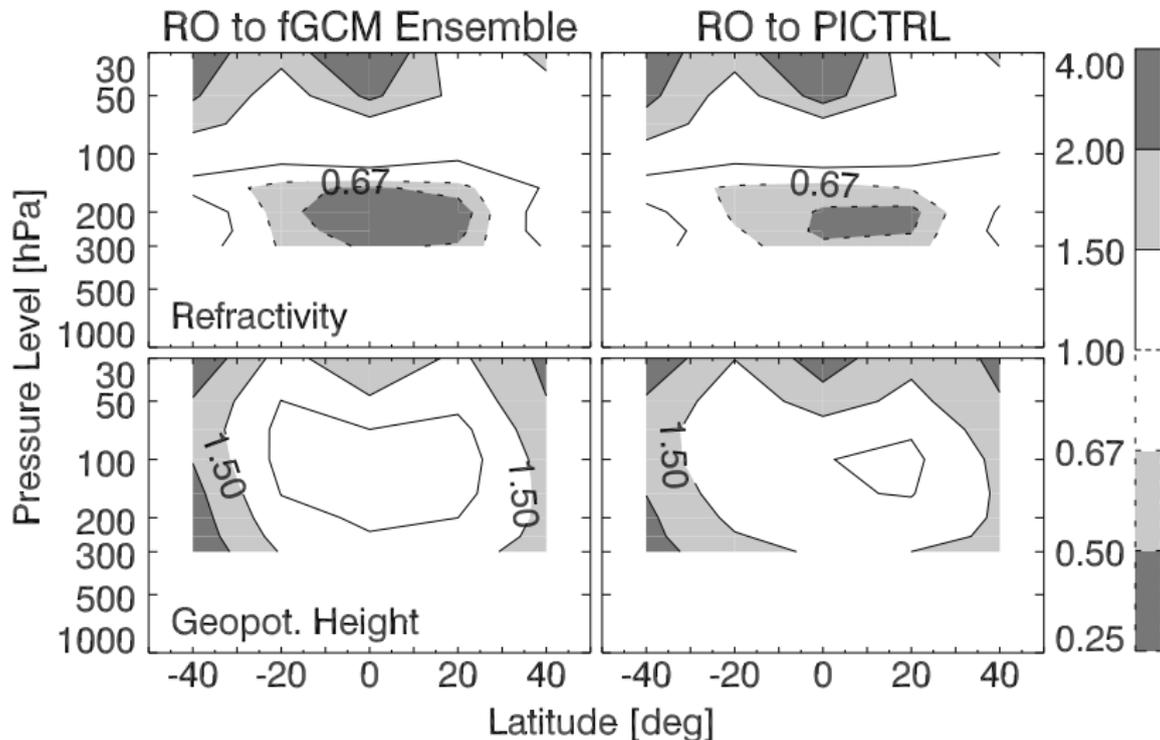

Active Radiosonde Stations From 10/1995-02/2008

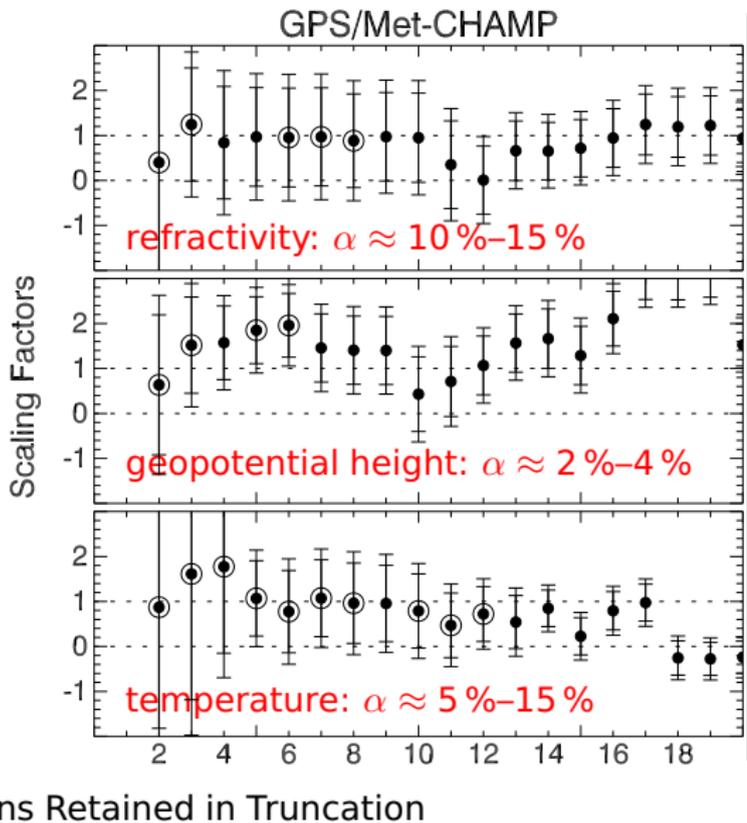

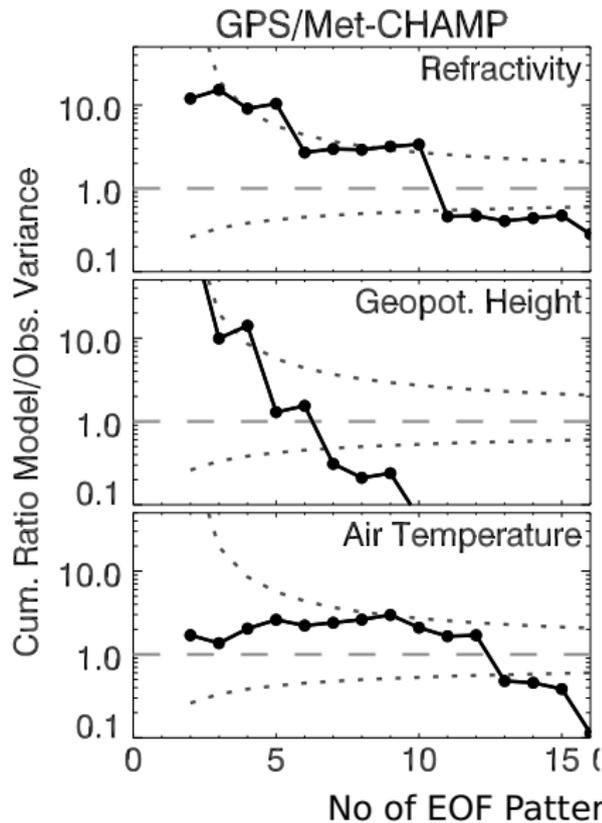

RO Events January 2006 (50S-50N)

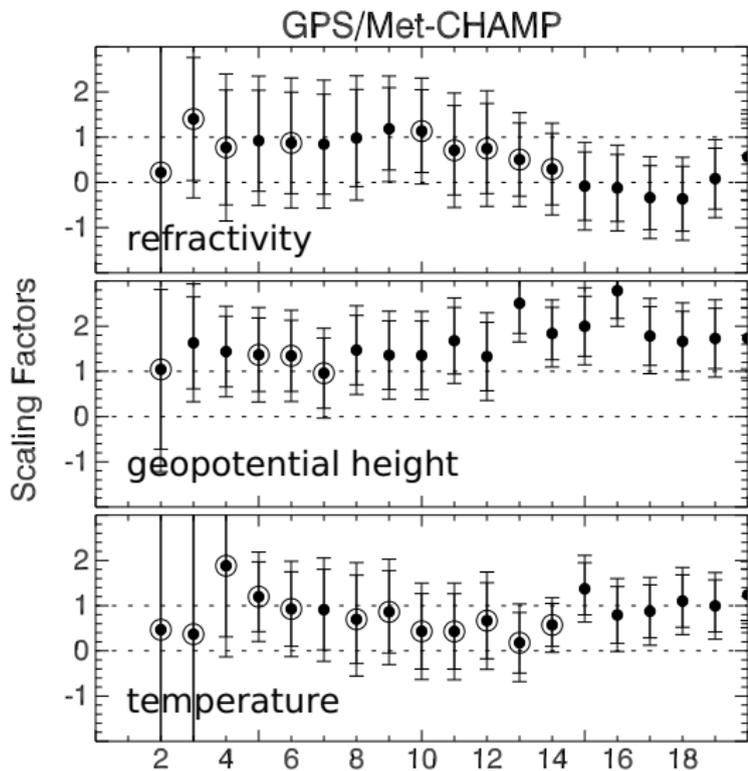

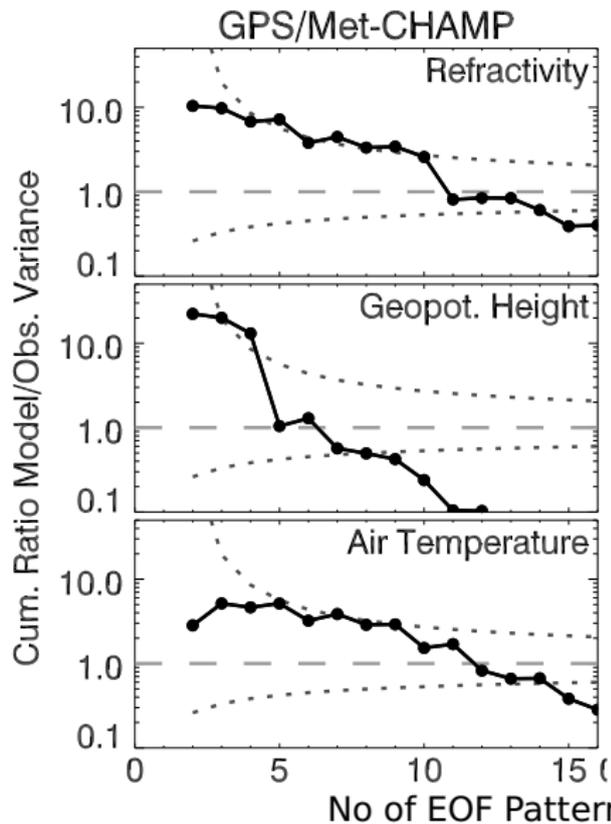

GCMs show higher UT and lower LS variability than RO

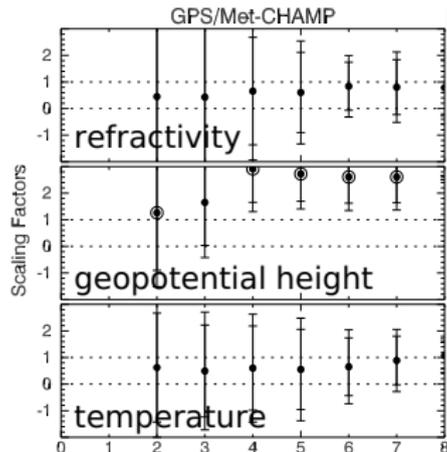

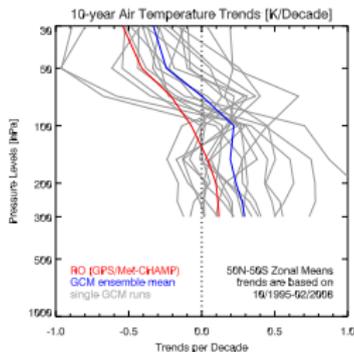

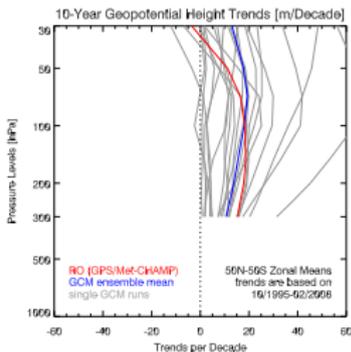

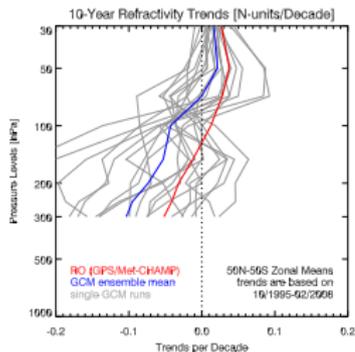

Residual Consistency Test and Uncertainty in Scaling Factors

Results of 10° Latitudinal Resolution

Results of Single Profile (50°S-50°N) Approach

- GCM trends of refractivity and temperature much stronger in UT, weaker in LS
- geopotential height trend similar
- only detection for geopotential height trends

- investigate usability of RO for climate change science
- test whether the 1995–2008 RO refractivity, geopotential height, and temperature trend patterns are consistent with GCM projections
- trend signal for CHAMP period (2001–2008) still masked by natural variability
- for 1995–2008 period, consistency of RO trend patterns with GCMs is given on
 - 90 % confidence level for temperature
 - slightly lower for refractivity
 - 95 % confidence level for geopotential height (robust results only if only large-scale aspects of pattern are resolved)
- consistency of single mean profiles only given for geopotential height
